

Project Scrum / Report-out

BookExchange - Presentation Support Document

Recommended presentation length	10-15 minutes
Demo environment	Localhost
Purpose	Support the in-class scrum update and software demo

1. Presentation Opening

BookExchange is a student-focused used-book marketplace prototype. Our goal is to make it easier for students to browse, post, and manage book listings in a classroom-ready prototype.

2. Problem Being Addressed

- Students often struggle to resell books efficiently.
- Campus alternatives may not give sellers good value.
- There is room for a simple, student-centered marketplace workflow.

3. What We Built

- A localhost prototype rather than a publicly hosted application.
- Browsing of available book listings.
- Listing details view for individual books.
- Book posting workflow for sellers.
- My Listings page for viewing personal posts.
- Delete functionality for seller-side listing management.
- Email-based seller contact.
- A partial login component.

4. Why Localhost Was Used

We are presenting the software in a localhost setting because the team did not have the budget to pay for hosting or a domain for this deliverable. Localhost allowed us to focus on building working functionality first.

5. Out-of-Scope Items

Out of scope	Reason for exclusion
Full authentication system	Too large for the current iteration; partial login only.
In-app messaging	Email contact was a simpler and workable

	substitute.
Peer rating system	Deferred until after the core workflow was stable.
Paid hosting / domain	Not feasible within the team's available budget.

6. Suggested Live Demo Flow

- Open the main page and explain the project goal.
- Browse current listings.
- Open a book details page.
- Post a new listing.
- Navigate to My Listings.
- Delete a listing.
- Show how the contact-seller email action works.
- Close by highlighting future enhancements.

7. Reflection Talking Points

- This activity was rewarding because it produced a real working prototype.
- The team liked seeing the project move from idea to usable software.
- The most difficult part was balancing ambition with time and resource limits.
- The team is most proud of completing a coherent marketplace workflow.
- We learned that good collaboration includes reducing scope when necessary and communicating trade-offs clearly.
- Going forward, we would build future iterations in phases: core workflow first, advanced features second.

8. What We Would Like More Help With

- Designing and implementing secure authentication.
- Planning deployment and hosting options for student projects.
- Structuring future database-backed and messaging features.

9. Closing Statement

Overall, this prototype demonstrates the essential BookExchange workflow and gives the team a strong foundation for future development. Although several advanced features remain out of scope, the current version is functional, demonstrable, and aligned with the goals of this project stage.
